

Configure a virtual host directive for your domain.

<https://www.rosehosting.com/blog/apache-virtual-hosts-on-centos/>

```
# vim /etc/httpd/conf.d/your_domain.conf
```

```
<VirtualHost *:80>
  ServerAdmin email@your_domain.com
  DocumentRoot "/var/www/html/your_domain/"
  ServerName your_domain.com
  ServerAlias www.your_domain.com
  ErrorLog "/var/log/httpd/your_domain.com-error_log"
  CustomLog "/var/log/httpd/your_domain.com-access_log" combined

  <Directory "/var/www/html/your_domain/">
    DirectoryIndex index.html index.php
    Options FollowSymLinks
    AllowOverride All
    Require all granted
  </Directory>
</VirtualHost>
```

```
# mkdir /var/www/html/your_domain/
# chown apache:apache -R /var/www/html/your_domain/
```
